

- I would like a comprehensive eye examination.
- I would like to wear contact lenses this year.
- I would like to be evaluated for Orthokeratology.

## DIGITAL RETINAL IMAGING AND OPTICAL COHERENCE TOMOGRAPHY

**Digital Retinal Imaging** allows us to take digital photographs of your retina. This procedure assists the doctor in the documentation of many ocular diseases. The process is quick, painless and is completely non-invasive. **Optical Coherence Tomography** (or OCT) is a cross-sectional, high resolution image. This process is also quick, painless and nothing touches the eye. It is very similar to an ultrasound, though it is done by measuring light and not sound.

Both of these tests are done simultaneously and are not covered by your insurance. If you do not wish to have these images taken, you acknowledge that you do not want to utilize the best technology to document your ocular health.

## VISUAL FIELD SCREENING

**Visual Field Screening** tests the integrity of the optic pathways as it passes from the eye into the brain. It is a non-invasive, computerized test which helps detect early signs of glaucoma, optic nerve disorders, retinal diseases and even certain brain tumors which may not be detected during a normal eye exam.

This test takes less than 1 minute per eye to complete and is not covered by insurance. If you do now wish to have this screen completed, you acknowledge that you do not want to utilize the best technology to document your ocular health.

**I understand that these tests costs \$44 and are the best way to document my ocular health.**
